Thus, to determine the nadir point, having brought the circle division which is nearest to the nadir point reading under microscope A, let the mean reading obtained from all the microscopes be called C. Bring the micrometer thread into coincidence with its image, and let the micrometer reading be M0, which we shall suppose to be converted into arc by multiplying by the value of a revolution found according to Art. 46 or 47. It is now evident that when the telescope is directed upon a star, if the micrometer reading remains M0 while the thread bisects the star and the circle reading is C, the nadir distance is C--C0, precisely as if the micrometer thread were fixed. But the reading C will, in general, involve an error of runs, to avoid which, set the circle as before upon a neighboring...
