Excerpt: .lary canal is not often involved, but with the localized osteitis we may have an extensive periostitis, Fig. 177. When the infection starts in the joint we have extensive destruction of both articulating surfaces, and finally the disease breaks through one of the cartilaginous surfaces and destroys to a more or less degree the head of the bone where the cancellous bone is present; and again the infection extends but slowly into the medullary canal proper. Cartilage is quite resistant to infection, and it is only the more virulent organisms, such as streptococcus, etc., that produce such conditions, Fig. 178. In compound fractures (Fig. 179) the infection is carried directly to the medullary cavity and raw, exposed bone surfaces, so that periosteum, cortex and medullary canal may be involved simultaneously. The question naturally arises: Does osteomyelitis give us a constant roentgenological picture? The answer...
